#### 21 March 2012

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

#### The SHA-3 Competition

- Most standardized hash functions suffer from attacks
- NIST launched a SHA-3 competition
- December 2010: five finalists selected: BLAKE, Grøstl, JH, KECCAK, Skein
- None of them is broken yet  $\rightarrow$  Important to perform cryptanalysis on them
- We focus on KECCAK (designed by Bertoni, Daemen, Peeters and Van Assche)

# Outline

- 3 Differential Path Search
  - The Rebound Attack

#### **Our Goals**

- Hard to find collision or preimage attacks
- We look for differential distinguishers
- on reduced-round versions of the internal permutation used in KECCAK (KECCAK-f)
- The Sponge proof relies on the fact that the internal permutation is ideal

# Previous Cryptanalysis Results on KECCAK

So far, the results on KECCAK are the following:

- J.-P. Aumasson and W. Meier (2009): Zero-sum distinguishers up to 16 rounds of KECCAK-*f*[1600].
- P. Morawiecki and M. Srebrny (2010): Preimage attack using SAT solvers on up to 3 rounds of KECCAK.
- D. J. Bernstein (2010):

A second-preimage attack on 8 rounds with high complexity.

• C. Boura et al. (2010-2011):

Zero-sum partitions distinguishers to the full 24-round version of KECCAK-f[1600].

#### M. Naya-Plasencia et al. (2011) : Practical attacks on a small number of rounds.

## Outline

1 Introduction

- 3 Differential Path Search
- 4) The Rebound Attack
- 5 Results and Further Work

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

# The Sponge Construction

# The KECCAK-f State

- The *b* bit KECCAK-*f* state: a  $5 \times 5 \times 2^{\ell}$  bit array
- 7 versions of KECCAK- $f: \ell = 0, ..., 6$  named KECCAK-f[b]

# The KECCAK-f Internal Permutation

- *b*-bit KECCAK round permutation *R<sub>r</sub>* applied on *n<sub>r</sub>* rounds
- $n_r = 12 + 2\ell$
- 24 rounds for KECCAK-f[1600]
- R<sub>r</sub> is divided into 5 substeps
- $\mathbf{R}_{\mathbf{r}} = \iota_{\mathbf{r}} \circ \chi \circ \pi \circ \rho \circ \theta$

#### The $\theta$ Permutation

$$\boldsymbol{R}_{\boldsymbol{r}} = \iota_{\boldsymbol{r}} \circ \chi \circ \pi \circ \rho \circ \boldsymbol{\theta}$$

#### The $\theta$ permutation

Linear mapping that provides a high level of diffusion

$$a[x][y][z] \leftarrow a[x][y][z] + \sum_{i=0}^{4} a[x-1][i][z] + \sum_{i=0}^{4} a[x+1][i][z-1]$$

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

# The $\rho$ Permutation

$$\boldsymbol{R}_{\boldsymbol{r}} = \iota_{\boldsymbol{r}} \circ \chi \circ \pi \circ \boldsymbol{\rho} \circ \boldsymbol{\theta}$$

#### The $\rho$ permutation

Linear mapping that provides inter-slice diffusion. Each lane is rotated by a constant depending on x and y

#### The $\pi$ Permutation

$$\boldsymbol{R_r} = \iota_r \circ \chi \circ \boldsymbol{\pi} \circ \rho \circ \boldsymbol{\theta}$$

#### The $\pi$ permutation

Rotation within a slice. Breaks column alignment.

Bit at position 
$$(x', y')$$
 is moved to  $\begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 2 & 3 \end{pmatrix} \begin{pmatrix} x' \\ y' \end{pmatrix}$ .

# The $\chi$ Permutation

$$\boldsymbol{R}_{\boldsymbol{r}} = \iota_{\boldsymbol{r}} \circ \boldsymbol{\chi} \circ \pi \circ \rho \circ \boldsymbol{\theta}$$

The  $\chi$  permutation

Only non-linear layer

 $s = 5 \times 2^{\ell}$  Sboxes (one per row)

$$a[x] \leftarrow a[x] + ((\neg a[x+1]) \land a[x+2])$$

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

## The $\iota_r$ Permutation

$$\boldsymbol{R}_{\boldsymbol{r}} = \boldsymbol{\iota}_{\boldsymbol{r}} \circ \chi \circ \pi \circ \rho \circ \theta$$

- Depends on the round number
- Addition of round constants to the first lane a[0][0][.]
- Breaks the symmetry of the rounds
- For differential cryptanalysis we ignore it

#### Summary

- We have one linear layer  $\rightarrow \lambda := \pi \circ \rho \circ \theta$
- One non-linear layer  $\chi$
- One round constant layer that we ignore *ι*<sub>r</sub>

# Outline

#### 2 Keccak

#### The Rebound Attack

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

# Diffusion in KECCAK

- Diffusion comes mostly from  $\theta$
- $\pi$  and  $\rho$  move bits around
- $\chi$  has a very slow diffusion

#### Diffusion of $\theta$ (at most 11 new active bits)

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

## Diffusion in KECCAK

- Diffusion comes mostly from  $\theta$
- $\pi$  and  $\rho$  move bits around
- $\chi$  has a very slow diffusion

Diffusion of  $\theta^{-1}$  (half of the bits are active in average)

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

#### **Useful Properties**

# The Column-Parity Kernel

$$\theta: \quad a[x][y][z] \leftarrow a[x][y][z] + \sum_{i=0}^{4} a[x-1][i][z] + \sum_{i=0}^{4} a[x+1][i][z-1] .$$

Even number of active bits in every column  $\rightarrow$  no diffusion through  $\theta$ 

We call the set of such states the column-parity kernel (CPK)

#### Path Search Algorithm

$$a_0 \xleftarrow{\lambda^{-1}} b_0 \xleftarrow{\chi^{-1}} \mathbf{a_1} \xrightarrow{\lambda} b_1 \xrightarrow{\chi} a_2 \xrightarrow{\lambda} b_2 \xrightarrow{\chi} a_3 \xrightarrow{\lambda} b_3 \cdots$$

- We start with random state in the CPK with  $\leq k$  active columns
- We compute forward taking random "best" slice transition
- By "best", we mean a transition that maximizes the number of columns with even parity and with lowest Hamming weight
- If path has best DP : one round backwards

#### Differential paths results on KECCAK

b	best differential path probability					
	1 rd	2 rds		3 rds		
400	2 <sup>-2</sup> (2)	2 <sup>-8</sup>	(4 - 4)	2 <sup>-24</sup>	(8 - 8 - 8)	
800	2 <sup>-2</sup> (2)	2 <sup>-8</sup>	(4 - 4)	2 <sup>-32</sup>	(4 - 4 - 24)	
1600	2 <sup>-2</sup> (2)	2 <sup>-8</sup>	(4 - 4)	2 <sup>-32</sup>	(4 - 4 - 24)	

b	best differential path probability					
		4 rds	5 rds			
400	2 <sup>-84</sup>	(16 - 14 - 12 - 42)	2 <sup>-216</sup>	(16 - 32 - 40 - 32 - 96)		
800	2 <sup>-109</sup>	(12 - 12 - 12 - 73)	2 <sup>-432</sup>	(32 - 64 - 80 - 64 - 192)		
1600	2 <sup>-142</sup>	(12 - 12 - 12 - 106)	2 <sup>-709</sup>	(16 - 16 - 16 - 114 - 547)		

• Three round paths with  $2^{-32}$  are best we can hope (see next talk)

Path with 2<sup>-709</sup> was independently improved by M. Naya-Plasencia et al. to 2<sup>-510</sup>.

## Simple Distinguishers

Easy distinguisher: fixed input/output difference

Generic complexity

Mapping a fixed input/output difference: 2<sup>b</sup>

# Simple Distinguishers

# One free round: choose value for each of the Sboxes $\rightarrow Use$ freedom degrees

Generic complexity

Mapping a fixed input/output difference: 2<sup>b</sup>

# Simple Distinguishers

Map a set of input differences to a set of output differences:

#### Generic complexity

Limited birthday distinguisher (Gilbert and Peyrin):

$$\max\left\{\min\left\{\sqrt{2^{b}/\Gamma^{\text{in}}},\sqrt{2^{b}/\Gamma^{\text{out}}}\right\},\frac{2^{b}}{\Gamma^{\text{in}}\times\Gamma^{\text{out}}}\right\}$$

# Outline

- 1 Introduction
  - 2 Keccak
  - 3 Differential Path Search
  - The Rebound Attack
- 5 Results and Further Work

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

#### The Rebound Attack

- Proposed first by Mendel et al. in 2009.
- We divide the rounds into three parts

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

#### The Rebound Attack

- Proposed first by Mendel *et al.* in 2009.
- Inbound Phase: find matching differences with probability p<sub>match</sub>. Usually all Sboxes active in the middle

#### The Rebound Attack

- Proposed first by Mendel *et al.* in 2009.
- Outbound Phase: generate N<sub>match</sub> values from this match and propagate backward and forward with probability p<sub>B</sub> and p<sub>F</sub>

#### Rebound Attack is Hard on KECCAK

- We tried to apply the rebound directly with the 4-round path
   → Would give 9 rounds with complexity < 2<sup>512</sup>
- Not enough differential paths to perform the inbound
- KECCAK has *weak alignment*: impossible to exploit truncated differentials or Super-Sboxes
- DDT: fixed input difference  $\rightarrow$  all possible output differences occur with same probability
- Number of possible output differences depends strongly on the Hamming weight of the input

#### **Forward Paths**

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

#### **Backward Paths**

- We need *enough differential paths* for the inbound.
- We need *differential paths with good DP* for the outbound.

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

We start in the CPK with X active columns and 2 active bits each

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

21.03.2012 27 / 35

# We let the differences spread in the first round $\rightarrow$ Round for free

We keep the paths with at most one active bit per Sbox.

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

If HW=1 at input of Sbox, there always exists an output difference with HW=1 and two differences with HW=2. We select  $k \ 1 \mapsto 2$  transitions. Remaining transitions :  $1 \mapsto 1$ 

# Expansion through $\theta$ $\rightarrow$ Much more active bits.

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

#### We keep the paths that have a "good" DP

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

21.03.2012 27 / 35

We want all Sboxes active to simplify analysis

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

# Inbound Complexity

- We need to compute the probability of having a match p<sub>match</sub> for the inbound
- We could use the average probability that a transition is possible
- Incorrect in practice
- Depends on the input Hamming weight: 4/31 for Hw = 1, 16/31 for Hw = 4
- Separation into Hamming weight classes: for every possible input Hamming weight, we compute the probability of a match

# Outbound Complexity Problems

- We need to compute the number of values *N*<sub>match</sub> we can generate from a match
- Same idea
- Number of solutions decreases exponentially with the Hamming weight
- Probability of having a match *increases exponentially*
- Average number of solutions not possible: we expect only one match

#### **Outbound Complexity**

- We call *N<sub>w</sub>* the expected number of solutions when the input Hamming weight is *w*
- Same analysis (we consider all Hamming weight distributions)
- We select a *w*<sub>max</sub>: *highest Hamming weight we can afford*
- $N_{\text{match}} \ge N_{W_{\text{max}}}$
- We need to update p<sub>match</sub>: a match occur only below w<sub>max</sub>

### **Finding Parameters**

- We need to set X, k and the bound on the DP p<sub>B</sub> for the backward paths
- With the best parameters we found, we get

Complexity of 2<sup>491.47</sup> for 8 rounds (4 forward, 3 backward, 1 inbound)

Generic complexity is  $\geq 2^{1057.6}$ .

# Outline

#### 2 Keccak

- 3 Differential Path Search
- 4) The Rebound Attack

#### **Overall Results**

Table: Best differential distinguishers complexities for each version of KECCAK internal permutations, for 4 up to 8 rounds

b	best differential distinguishers complexity						
	4 rds	5 rds	6 rds	7 rds	8 rds		
100	2 <sup>2</sup>	2 <sup>8</sup>	2 <sup>19</sup>	-	-		
200	2 <sup>2</sup>	2 <sup>8</sup>	2 <sup>20</sup>	2 <sup>46</sup>	-		
400	2 <sup>2</sup>	2 <sup>8</sup>	2 <sup>24</sup>	2 <sup>84</sup>	-		
800	2 <sup>2</sup>	2 <sup>8</sup>	2 <sup>32</sup>	2 <sup>109</sup>	-		
1600	2 <sup>2</sup>	2 <sup>8</sup>	2 <sup>32</sup>	2 <sup>142</sup>	<b>2</b> <sup>491.47</sup>		

Our model and our method have been **verified in practice** on KECCAK-*f*[100]

We obtained a 6 round rebound attack with complexity 2<sup>28.76</sup>

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack

#### **Further Work**

#### Use the differential path search algorithm for

- the collision/preimage KECCAK "crunchy" challenges:
  → We found collisions for 1 and 2-round challenges
- differential distinguisher on the hash function

Analyze other functions with our framework

#### Thank You!

Duc, Guo, Peyrin, Wei (EPFL, I<sup>2</sup>R, NTU)

Unaligned Rebound Attack
