

Hash Functions Based on Three Permutations: A Generic Security Analysis

Bart Mennink and Bart Preneel
KU Leuven

CRYPTO 2012 — August 21, 2012

Motivation

- Hash functions based on block ciphers
 - Davies-Meyer '84, PGV '93, Tandem-DM '92, ...
 - MD5 '92, SHA-1 '95, SHA-2 '01, Blake '08, Skein '08, ...

Motivation

- Hash functions based on block ciphers
 - Davies-Meyer '84, PGV '93, Tandem-DM '92, ...
 - MD5 '92, SHA-1 '95, SHA-2 '01, Blake '08, Skein '08, ...
- Re-keying \rightarrow related-key security, efficiency loss, ...

Motivation

- Hash functions based on block ciphers
 - Davies-Meyer '84, PGV '93, Tandem-DM '92, ...
 - MD5 '92, SHA-1 '95, SHA-2 '01, Blake '08, Skein '08, ...
- Re-keying \rightarrow related-key security, efficiency loss, ...
- Instead use **fixed-key** block ciphers, or permutations

Motivation

- Black-Cochran-Shrimpton '05:
no secure $2n$ -to- n -bit function
using 1 n -bit permutation call

Motivation

- Black-Cochran-Shrimpton '05:
no secure $2n$ -to- n -bit function
using 1 n -bit permutation call

- Generalized by Rogaway-Steinberger '08, Stam '08, Steinberger '10
 - mn -to- rn -bit function using k n -bit permutations: collisions in $(2^n)^{1-(m-r+1)/(k+1)}$ queries (almost always)

	F	2 π	3 π	4 π	5 π
$2n \rightarrow n$		$2^{n/3}$	$2^{n/2}$		
$\frac{5}{2}n \rightarrow n$		$2^{n/6}$	$2^{3n/8}$	$2^{n/2}$	
$4n \rightarrow 2n$		1	$2^{n/4}$	$2^{2n/5}$	$2^{n/2}$

Motivation

- Black-Cochran-Shrimpton '05:
no secure $2n$ -to- n -bit function
using 1 n -bit permutation call

- Generalized by Rogaway-Steinberger '08, Stam '08, Steinberger '10
 - mn -to- rn -bit function using k n -bit permutations: collisions in $(2^n)^{1-(m-r+1)/(k+1)}$ queries (almost always)

F	2π	3π	4π	5π
$2n \rightarrow n$	$2^{n/3}$	$2^{n/2}$		
$\frac{5}{2}n \rightarrow n$	$2^{n/6}$	$2^{3n/8}$	$2^{n/2}$	
$4n \rightarrow 2n$	1	$2^{n/4}$	$2^{2n/5}$	$2^{n/2}$

Security Model

- Ideal permutation model: π_i 's randomly generated
- Adversary query access to π_i 's

Security Model

- Ideal permutation model: π_i 's randomly generated
- Adversary query access to π_i 's

$$\mathbf{Adv}_F^{\text{col}}(q) = \max_{\mathcal{A}} \text{success probability } \mathcal{A}$$

Security Model

- Ideal permutation model: π_i 's randomly generated
- Adversary query access to π_i 's

$$\mathbf{Adv}_F^{\text{col}}(q) = \max_{\mathcal{A}} \text{success probability } \mathcal{A}$$

$$\mathbf{Adv}_F^{\text{epre}}(q) = \max_{\mathcal{A}} \max_{z \in \{0,1\}^n} \text{success probability } \mathcal{A}$$

Prior Constructions — Shrimpton-Stam '08

- $2n$ -to- n -bit function using 3 one-way functions
- Optimal collision security
- Collision security if $f_i(x) = \pi_i(x) \oplus x$ (showed by automated analysis)

Prior Constructions — Rogaway-Steinberger '08

- $2n$ -to- n -bit function (over \mathbb{F}_{2^n}) using 3 permutations

Prior Constructions — Rogaway-Steinberger '08

- $2n$ -to- n -bit function (over \mathbb{F}_{2^n}) using 3 permutations
- Collision/preimage security if a_{ij} satisfy “independence criterion”
→ Excludes binary a_{ij}

Our Compression Function Design

- $2n$ -to- n compression function using permutations and \oplus -operators

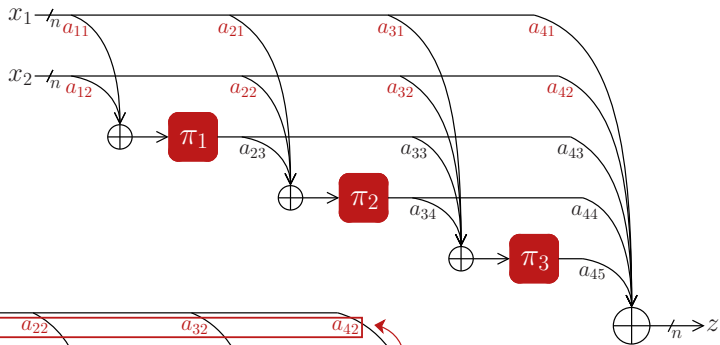

Our Compression Function Design

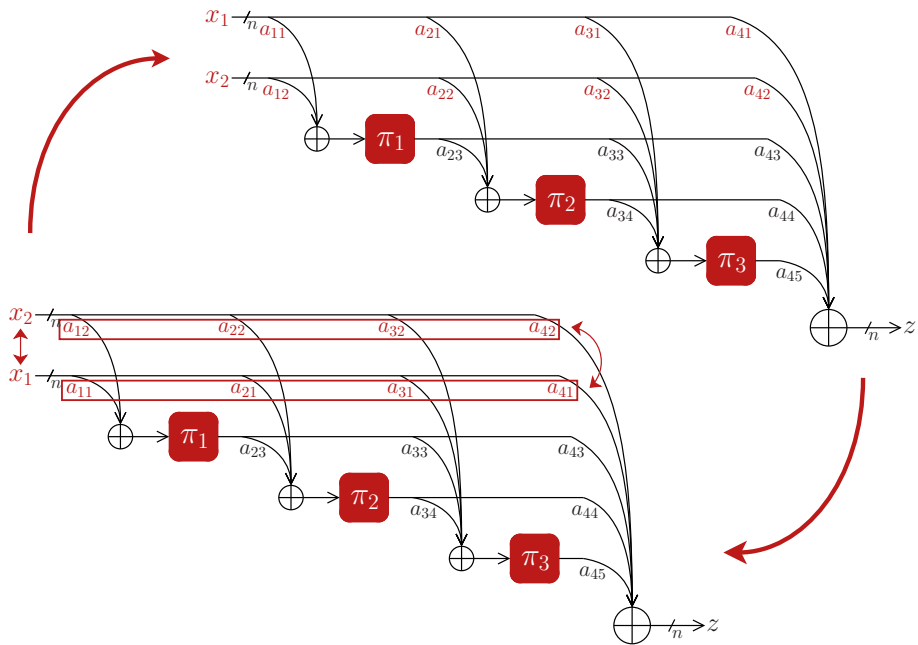

- $2n$ -to- n compression function using **permutations** and \oplus -operators

- **Multi-permutation setting:** π_i 's all different
- **Single-permutation setting:** $\pi_1 = \pi_2 = \pi_3$

Equivalence Classes

Definition: Equivalence Class

Compression functions F and F' are **equivalent** if for both collision and preimage security there exists a tight bi-directional reduction

- Intuition: F and F' **equivalent** \rightarrow 'equally secure'

Equivalence Classes

Definition: Equivalence Class

Compression functions F and F' are **equivalent** if for both collision and preimage security there exists a tight bi-directional reduction

- Intuition: F and F' **equivalent** \rightarrow 'equally secure'
- We identify 4 equivalence reductions
 - Example reduction of previous slide
 - 3 extra reductions
- We restrict to equivalence **w.r.t. these reductions** only

Multi-Permutation Setting — Main Result

Multi-Permutation Setting — Main Result

F equivalent to:	collision	preimage
F_1, F_4	✓[c]	✗
F_2	✓[c]	✓[c]
F_3	✓	✗
none of these	✗	?

Multi-Permutation Setting — Proof Idea (1)

Multi-Permutation Setting — Proof Idea (1)

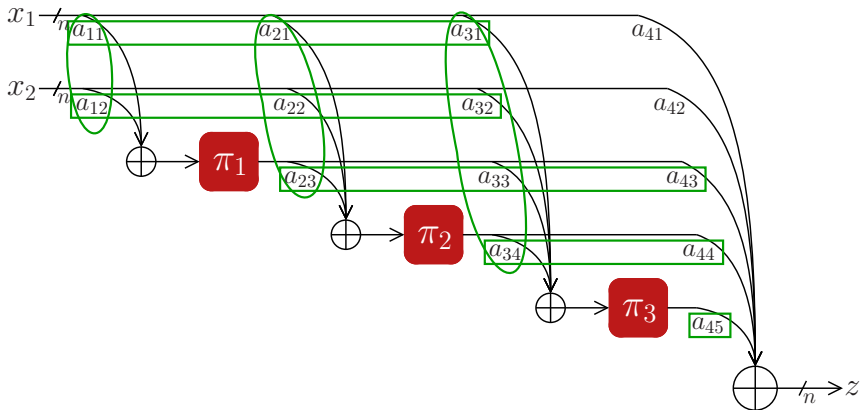

- In total 2^{14} schemes, but many trivially insecure
- Function is “valid” if each green set contains a 1
- We consider valid compression functions only

Multi-Permutation Setting — Proof Idea (2)

Multi-Permutation Setting — Proof Idea (2)

- Any valid F equivalent to some F' with
 $(a_{11}, a_{12}) = (1, 0)$ and $(a_{21}, a_{22}, a_{23}) = (0, 1, 0)$

Multi-Permutation Setting — Proof Idea (2)

- Any valid F **equivalent** to some F' with
 $(a_{11}, a_{12}) = (1, 0)$ and $(a_{21}, a_{22}, a_{23}) = (0, 1, 0)$
- It suffices to consider these functions only

Multi-Permutation Setting — Proof Idea (3)

Multi-Permutation Setting — Proof Idea (3)

- Four generic attacks

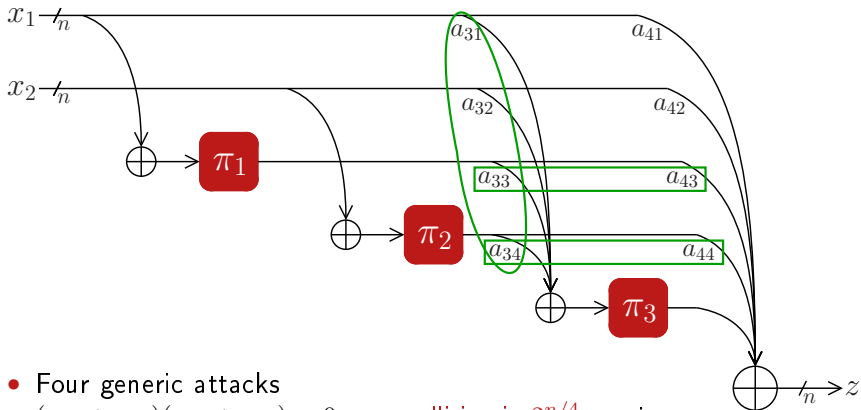

$(a_{31} + a_{33})(a_{32} + a_{34}) = 0 \implies$ collision in $2^{n/4}$ queries

$\bigvee_{j=1}^4 a_{3j} = a_{4j} = 0 \implies$ collision in $2^{n/3}$ queries

$\bigwedge_{j=1}^2 a_{3j}a_{4,j+2} \neq a_{3,j+2}a_{4j} \implies$ collision in $2^{n/3}$ queries

$a_{41} + a_{42} + a_{43} + a_{44} = 1 \implies$ collision in $2^{2n/5}$ queries

Multi-Permutation Setting — Proof Idea (3)

- Four generic attacks
- $(a_{31} + a_{33})(a_{32} + a_{34}) = 0 \implies$ collision in $2^{n/4}$ queries
- $\bigvee_{j=1}^4 a_{3j} = a_{4j} = 0 \implies$ collision in $2^{n/3}$ queries
- $\bigwedge_{j=1}^2 a_{3j}a_{4,j+2} \neq a_{3,j+2}a_{4j} \implies$ collision in $2^{n/3}$ queries
- $a_{41} + a_{42} + a_{43} + a_{44} = 1 \implies$ collision in $2^{2n/5}$ queries
- F is collision secure **only if** equivalent to F_1, F_2, F_3, F_4

Multi-Permutation Setting — Proof Idea (4)

- F is collision secure **only if** it is equivalent to F_1, F_2, F_3, F_4

Multi-Permutation Setting — Proof Idea (4)

- F is collision secure **only if** it is equivalent to F_1, F_2, F_3, F_4
- Remains to prove: **if**-relation and preimage resistance

Multi-Permutation Setting — Proof Idea (4)

- F is collision secure **only** if it is equivalent to F_1, F_2, F_3, F_4
- Remains to prove: **if**-relation and preimage resistance
- Hardest and most technical part
 - F_1, \dots, F_4 **collision resistant** up to $2^{n/2}$ queries tight (asympt.)
 - F_2 **preimage resistant** up to $2^{2n/3}$ queries tight (asympt.)
 - F_1, F_3, F_4 **preimage resistant** up to $2^{n/2}$ queries tight

Multi-Permutation Setting — Conjecture

Z : set of q random elements from $\{0, 1\}^n$ (duplicates may occur)

X, Y : **any** two sets of q elements from $\{0, 1\}^n$ (no duplicates)

Conjecture

With high probability, there exist $O(q \log q)$ tuples
 $(x, y, z) \in X \times Y \times Z$ such that $x \oplus y = z$

- Conjecture relates to area of extremal graph theory
- Similar to (but more complex than) a longstanding problem of Zarankiewicz from 1951
- Detailed heuristical argument in paper

Single-Permutation Setting — Main Result

Theorem

For any compression function of this form, collisions can be found in $2^{2n/5}$ queries (proof is similar)

Single-Permutation Setting — Main Result

Theorem

For any compression function of this form, collisions can be found in $2^{2n/5}$ queries (proof is similar)

Conclusions

Complete classification of $2n$ -to- n -bit compression functions solely based on three permutations and \oplus -operators

- **Multi-permutation** setting: analysis of 2^{14} functions
 - 216 functions optimally collision secure
 - 48 of which optimally preimage secure
- **Single-permutation** setting: non-existence of collision secure F
 - Attack on 2^{14} (or in fact $2^{4n}2^{14}$) functions

Conclusions

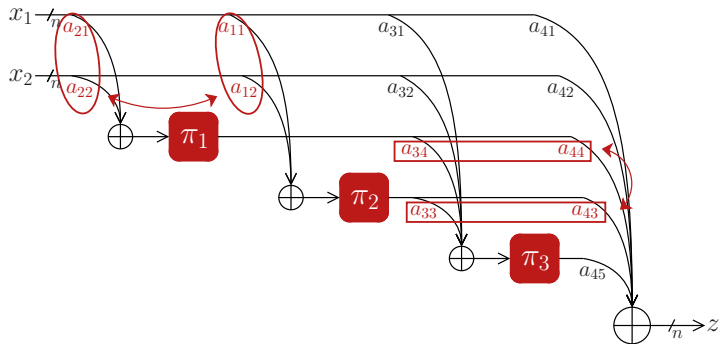

Complete classification of $2n$ -to- n -bit compression functions solely based on three permutations and \oplus -operators

- **Multi-permutation** setting: analysis of 2^{14} functions
 - 216 functions optimally collision secure
 - 48 of which optimally preimage secure
- **Single-permutation** setting: non-existence of collision secure F
 - Attack on 2^{14} (or in fact $2^{4n}2^{14}$) functions
- Research directions:
 - Generalize to larger F 's, and with different primitives
 - Generalize impossibility result in single-permutation setting
 - Conjecture

Thank you for your attention!

Supporting slides

Summary of Our Results

F equivalent to:	collision		preimage	
	security	attack	security	attack
F_1, F_4	$2^{n/2}$ [c]	$2^{n/2}$	$2^{n/2}$	$2^{n/2}$
F_2	$2^{n/2}$ [c]	$2^{n/2}$	$2^{2n/3}$ [c]	$2^{2n/3}$
F_3	$2^{n/2}$	$2^{n/2}$	$2^{n/2}$	$2^{n/2}$
none of these	?	$2^{2n/5}$?	?
any F in SP-setting	?	$2^{2n/5}$?	?
